TASK – Windows Edition

A complete tidal analysis and prediction suite of software
developed by the National Oceanography Centre

What is TASK?

TASK (Tidal Analysis Software Kit) is a complete software solution for the harmonic analysis of data from tide gauges right through to the prediction of tides into the future and the production of formatted tide tables.

The original version of TASK was developed about 15 years ago and was based on the harmonic analysis techniques developed at the National Oceanography Centre (then the Proudman Oceanographic Laboratory) and used throughout the world. However, being based on an old command line interface (DOS for those that remember such things), it was clumsy to use and had limited internal quality control. This meant it was up to the tidal analyst to spot any potential problems with the data that could lead to errors in output with no assistance from the software.

TASK – Windows Edition is a completely new version of the software. There is little in common between TASK – Windows Edition, and TASK-2000 other than the high-precision and accuracy of the mathematical harmonic analysis engine and the name.

The Philosophy behind TASK – Windows Edition

- Produce a harmonic analysis package that is easy to use for both the experienced tidal analyst as well as newcomers to working with tidal data.

- Create software that is robust and configurable yet quick to get the results you need.
- Build in intelligence so it can assess its own results to see if they look sensible, and advise the analyst.
- Create a complete tide gauge to tide table solution.
- Provide a set of tools to be able to deal with problematic data.
- Create a documented workflow which can be followed to get consistent results.
- Create a professional product suitable for both commercial use and academic research.
- All files used and generated are plain text giving the user complete flexibility to choose their own supplementary tools and integrate the software into existing systems.
- TASK – Toolkit: For processing, resampling and QA of data
- TASK – DMT: A separate data manipulation module
- TASK – Analyse: The main harmonic analysis module
- TASK – Plot: A plotting program that replaces the Excel template from TASK ver. 1
- POLTIPS•3: The tidal prediction component with the capability to generate fully formatted tide table layouts.

All programs are written to run under Microsoft Windows (XP, Vista, 7, 8, 10). Apple users will need to dual boot to Windows, use a Virtual Machine (e.g. VMWare Fusion) or Windows Emulation (e.g. CrossOver).

The Basic Workflow

- Get your data into a comma separated format (CSV, UHSLC or TASK format). A basic level of knowledge in programs like Microsoft Excel makes this very easy.
- Run the data through TASK-Toolkit which will carry out QA, resample the data if necessary and convert it to the TASK file format (.t2k file).
- View the TASK format file in TASK-Plot if you wish for an initial quick visual scan of the data.

The Approach

TASK is a suite of individual programs which, although they can be used independently, are designed in such a way that they work together in an integrated manner. The main components are:

- TASK – Windows Edition: Use for launching the separate modules as required

- Use TASK-Analyse to carry out a harmonic analysis of the data. If you are happy with the results you can select to have the POLTIPS prediction software automatically update so that you are ready to produce fully formatted tide tables.
- Alternatively check the data in the Plot module – it will show the tide gauge data along with a prediction made from the computed harmonics and the residual. You can flag any data that looks bad if you wish, save the file and reanalyse if necessary.
- Use POLTIPS to produce your finished tide table if required, or compute interval data, turning points, graphs etc. for any date and time period required (subject to your software licence).

A Few of the Features

- Reads in simple CSV file formats (including data directly downloaded from University of Hawaii Sea Level Centre)
- Native file format is plain text with tools for manipulation and checking. This format has a data quality flag and supports 5 data channels (three are usually used for observation, prediction and residual)
- Data quality control is automatically carried out (e.g. gap detection, clock jumps). Potential problems are highlighted with an advisory flag and the analyst can choose to include/exclude these in the

analysis or manually inspect each one using TASK-Graph.

- Intelligent quality control in the analysis engine - the software carries out hundreds of checks throughout the analysis process to see if the data looks sensible and the results it computes are reasonable.
- Data resampling and format conversion.
- Data manipulation can shift and scale data ($D_{new} = m.D_{old} + c$; m and c set by user).
- Time shifting to correct for time zone issues, daylight saving etc.
- Handles data in any time zone.
- TASK-Plot gives you a simple visual tool to view the data (scroll and zoom easily) as well as flag any data that you are not happy with that will then be excluded from the harmonic analysis.
- A selection of preset harmonic constant sets for different data lengths, but custom configurable for the more experienced analyst.
- Automatic calculation of daily, monthly and annual means if required.
- Sensible auto file naming and overwrite protection.
- Drag and drop input files from any file windows into the modules.
- Automatic blocking of data is done completely behind the scenes – no need to fill gaps.
- Over 100 harmonics if required.

- Quality control statistics are output as part of the analysis process.
- POLTIPS•3 prediction software can produce complex tide table layout and graphs etc. Complete integration means the TASK-Analyse module will automatically update the POLTIPS•3 database and your new analysis results appear instantly in the list of ports.
- Comprehensive documentation. E-mail support for commercial and academic users.

Tidal Analysis Service

For clients that don't want to spend the time learning a new piece of software, the NOC also offers a tidal analysis service.

We can take your tide gauge data, carry out a full quality control of it and then perform the harmonic analysis. We can provide the results either as raw harmonic constants, a time series prediction of the tidal levels for any time period you require, or a bespoke copy of our easy-to-use POLTIPS prediction software pre-configured with the results of the harmonic analysis.

A selection of screenshots from the software.

The screenshots illustrate the following software components:

- TASK Toolkit:** A window for converting data files to TASK format. It includes sections for Input Options (File name, format selection like NOC CSV or UH-SLC, header lines, and flagging), Output Options, Processing Options (Gap Detection Threshold, Acceptable variance, HC Options), and Data range/Spike detect settings.
- TASK - Windows Edition:** The main splash screen for the software, providing navigation to various modules and the NOC website.
- TASK-Analyse:** A window for harmonic analysis, featuring input parameters (filename, format), record selection (Start/End Record, Count records), and harmonic constituent selection.
- TASK - Data Manipulation Tool (Stand-alone mode):** A window for data selection and adjustment. It allows processing all records or specific channels (6-10), adjusting data values (scaling, shifting), and flagging bad data (min/max values, flag value).
- TASKplot:** A plotting window showing a time-series plot of data. The plot displays observed data (blue dots), predicted data (green line), and residual data (magenta line) over a period from 2000 to 2005. The y-axis ranges from -1.0 to 3.0.

National Oceanography Centre Marine Data Products

The POLTIPS-3 tidal prediction software is available separately with a standard database of UK harmonic constants, or the option to add your own.
