held in the John Swallow Room)**

Dr John Swallow Bequest collection and cruise data boxes (including his book collection housed in the John Swallow Room) – Physical oceanographer

Brief biographical note

Dr Swallow –principally known for the development of neutrally buoyant floats, a method for measuring ocean currents in which a slowly falling sound source was tracked by sno-buoys at the surface with the source on the sea-floor, and for his discovery of the energetic variability of the deep ocean flow. Dr Swallow joined The National Institute of Oceanography in 1954. The first Swallow Float was constructed using a standard building site scaffolding tube whose dimensions were carefully adjusted to create with some simple electronics and nickel transducer. His first use of the floats was immediately successful in the eastern Atlantic, and yielded some of the facts oceanographers know now about the fluctuation of the deep currents there. A sideline of this research was the broadening of the National Institute of Oceanography's interest in precision echo-sounding, which was recognized at the time as a valuable navigational tool as well as for geophysical research. He predicted a southward undercurrent below the Gulf Stream. Henry Stommel (Woods Hole Oceanographic Institution) and John Swallow organized the Aries Expedition (1959/60) (named after the ketch that WHOI lent him for the work. This led to the clear identification of deep energetic eddies in the ocean, and contributed to a profound change in oceanographic thinking about circulation. His research radically altered the way we view the world's oceans and their dynamics.

Amongst his other achievements – his participation in the International Indian Ocean Expedition –Mid Ocean Dynamics Experiment which led to work on the circulation of the Arabian Sea and Equatorial Indian Ocean. He was prominent in planning the work in the Indian Ocean (INDEX International Expedition), and the resulting discoveries concerning the modes of evolution of the 'Somali Current' after the onset of the SW Monsoon. He received many awards including the Prince Albert I (Monaco) Medal.
